

Sample Problem

- Consider the following C program:

```
int main (int argc, char *arg[])
{
    fork ();
    if (fork ()) {
        fork ();
    }
    fork ();
}
```

Typical C coding style:
call fork() and if its
return value is non-zero
and do the if clause

- Question: How many processes does this program create?
